COMPONENTS	Test / box	25 Test / package
Tester (for single use)	1 test cassette (1 test / bag x 1 bag)	25 Test cassette (1 test / bag x 25 bags)
Tampon (for single use)	1 extraction tube, 500 µL extraction tampon	25 extraction tubes, each of which is 500 µL extraction tampon
Sampling sticks (for single use)	1 sterile, disposable sampling swab	25 sterile, disposable sampling stick
Package supplement	1 instruction sheet	1 instruction sheet

Table 1. Materials and Components

SARS-CoV-2 Rapid Antigen Test Kit	RT-Test result in PCR comparison		
	Positive	Negative	Total
Positive	674	5	679
Negative	18	572	590
Total	692	577	1269

Sensitivity: %97.40: (674/ 692), (%95 GA: 95.92 - 98.45)

Specificity: %99.13: (572/577), (%95 GA: 97.99 - 99.72)

Accuracy: %98.19: (674 + 572) / (1269)

Table 2. Performance Data (Nasopharyngeal swab)

SARS-CoV-2 Rapid Antigen Test Kit	RT-Test result in PCR comparison		
	Positive	Negative	Total
Positive	156	0	156
Negative	7	110	117
Total	163	110	273

Sensitivity: %95.71: (156/163), (%95 GA: 91.35, 98.26)

Specificity: %100: (110/110), (%95 GA: 96.70 - 100.00)

Accuracy: %97.44: (156+ 110) / 273

Table 3. Performance Data (Oropharyngeal swab)

SARS-CoV-2 Rapid Antigen Test Kit	RT-Test result in PCR comparison		
	Positive	Negative	Total
Positive	580	5	585
Negative	20	495	515
Total	600	500	1100

Sensitivity: %96.66: (580/600), (%95 GA: 94.90 - 97.95)

Specificity: %99.00: (495/500), (%95 GA: 97.68 - 99.67)

Accuracy: %97.72: (580 + 495) / (1100)

Table 4. Performance Data (Nasal swab)

PURPOSE OF USAGE**ENG**

The VIRUSCAN™ SARS-CoV-2 Rapid Antigen Test Kit is a lateral flow swab test designed for the qualitative/non-quantitative *in vitro* detection of SARS-CoV-2 nucleocapsid antigen in nasal, nasopharyngeal and oropharyngeal swab samples.

This test is only suitable for use in clinical laboratories or in close-to-patient examinations by professional users and provides assistance in diagnosing of a SARS-CoV-2 infection. The test is not designed for personal use. The test should not be used as the sole criterion to diagnose to the pneumonia arising from SARS-CoV-2 infection and to reach the conclusion that there is any pneumonia. A negative test result does not indicate the absence of SARS-CoV-2 infection. It is recommended to combine the patient's clinical findings and other laboratory tests for a comprehensive analysis of the disease. The test is suitable for patients of all ages.

SUMMARY AND EXPLANATION

This product is only used for the qualitative detection of SARS-CoV-2 antigen.

Positive result: If both C and T lines appear after 15-20 minutes, the test result is positive and valid.

If your test result is positive, please contact. Contact your family doctor immediately by running the RT-PCR test to confirm the result. To reduce the risk of infection, the incubation period varies between 1 - 14 days, mostly 3 - 7 days. The main symptoms are fever, fatigue, loss of smell and dry cough. A small number of nasal congestion, runny nose, sore throat, muscle pain and diarrhea are seen.

PRINCIPLE OF TEST

This reagent uses a double swab method with antibody for the qualitative detection of SARS-CoV-2 nucleocapsid antigen. During the application of test, a monoclonal anti-SARS-CoV-2 antibody labelled with colloidal gold are connected to the SARS-CoV-2 antigen in the sample. This reaction complex proceeds chromatographically on the nitrocellulose membrane and is connected to the pre-coated monoclonal anti-SARS-CoV-2 antibody at the detection zone (T) on the test membrane and creates a red reaction line there. If the sample does not contain SARS-CoV-2 antigen, a red colour reaction line cannot occur in the T zone.

At the same time, a Chicken-IgY-Gold conjugate moves across the membrane during testing and are connected to a pre-coated monoclonal Anti-Chicken-IgY-Antibody in quality control area C, creating a red reaction line there. Regardless of whether the sample to be examined contains the SARS-CoV-2 antigen or not, a red reaction line always occurs in the quality control area (C).

MATERIALS AND COMPONENTS

Materials supplied together with test kits
(Page 1, Table 1)

Note: Components of different kit lots should not be mixed. Additional required materials Personal protective equipment, timers.

Active components of the test

Reagents • mAb anti-COVID-19 antibodies grown in mice • mAb Anti-Chicken-IgY grown in mice • mAb anti-COVID-19 gold conjugated antibody grown in mice

STORAGE AND DURABILITY

1. Store the test kit at 2 °C - 30 °C. Do not store or freeze the kit below 2 °C. All components must be brought to room temperature before performing the test.

2. The test cassette should be used within 15 minutes after it is removed from the foil pouch.

3. The kit should not be used after its expiration date. The expiration date is stated on the label/packaging.

TEST PROCEDURE

Before testing, carefully read the instructions for use and follow the below mentioned instructions as described. Make sure that test components are at room temperature when they are used. The testing procedure includes the following steps: sampling, processing the sample, and performing the test.

Caution: Samples should be used as soon as possible after they are collected. After half an hour, the sample should not be used and a new sample should be taken by a new sample stick.

Caution: Samples should not be inactivated.

Caution: The way the sample is taken shows difference between each swab samples. Please perform only one of the specified swab samples (1a - 1c). **1a. Nasopharyngeal spreading:** Ask the patient to tilt his/her head back slightly. Then insert slowly the sterile swab with its head first into the nasopharynx until you feel a slight resistance. Turn the swab 3 times in a place near the inner wall of the nasal cavity and carefully remove the swab from the nose. Avoid contact with nasal mucosa when entering and exiting.

or 1b. Oropharyngeal spreading: Direct the sterile swab from the side of the uvula towards the back of the pharynx. Rub and twist the swab 10 times along the back of the pharynx and both tonsils. Then remove the stick. Avoid contact of the head of the swab with the tongue during sample collection.

or 1c. Anterior nasal swab: Insert the sterile swab into the anterior nasal part and turn the swab 3 times along the inner wall of the nasal cavity. Then remove the stick. (Page 1 Table 2)

b) Oropharyngeal swab

The performance of the SARS-CoV-2 Rapid Antigen Test Kit was evaluated by means of using 1269 nasopharyngeal swabs received from patients.

(Page 1 Table 3)

c) Nasal swab

The performance of the SARS-CoV-2 Rapid Antigen Test Kit was evaluated using 1100 nasal specimen (nasal swabs from patients. (Page 1 Table 4)

3. Turn the swab in the extraction tampon 10 times

along the inner wall of the extrac-

tion tube. Then, scrape swab head against the inner wall to ensure that the sample on the swab is completely unmingled into the tampon.

6. Remove the aluminium foil pouch from its packaging and place the test cassette horizontally on the table. 7. Break the tip of the dropper cap and add 3 drops from the extraction tube containing the processed sample to the sample well and start a timer. (Page 2 Figure 2a,2b,2c)

8. Dispose of all samples and materials used in the test as biological hazardous waste. Laboratory chemicals and biological hazardous waste should be disposed of in accordance with local regulations.

INTERPRETATION OF TEST RESULTS

This product is only used for the qualitative detection of SARS-CoV-2 antigen.

Positive result: If both C and T lines appear after 15-20 minutes, the test result is positive and valid.

If your test result is positive, please contact.

Contact your family doctor immediately by running the RT-PCR test to confirm the result.

To reduce the risk of infection, the incubation period varies between 1 - 14 days, mostly 3 - 7 days.

The main symptoms are fever, fatigue, loss of smell and dry cough.

A small number of nasal congestion, runny nose, sore throat, muscle pain and diarrhea are seen.
